UNIT - 1

Introduction to Finite Automata

- * Introduction to Finite Automata
- * Central concepts of Automata Theory
- * Deterministic finite Automata
- * Non deterministic Finite Automata

Introduction to Automata

Automata theory is the study of abstract computing devices or machines. Theory of computation is based on mathematical computations. These computations are used to represent various mathematical models.

There are several reasons why study of Automata is important. Finite Automata is important kinds of hardware and software. Some of the most important kinds are

- i) Software for designing and checking the behaviour of digital circuits
- ii) The Lexical Analyzer of typical compiler
- iii) Software for scanning large bodies of text such as collection of webpages, to find occurrence of words, phrases
- iv) Automata theory deals with design of finite state m/c
- v) Automata theory is base for design of formal languages

A. H. PRASAD

Assistant Professor

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 073

Central Concepts of Automata Theory

The most important definitions of terms that encompass the theory of automata includes

- i) Alphabets
- ii) Strings
- iii) Languages

Alphabets: An alphabet is a finite, non empty set of symbols. Conventionally the symbol Σ is used to represent set of alphabets. Common alphabet includes

- i) $\Sigma = \{0, 1\}$ the binary alphabet
- ii) $\Sigma = \{a, b, \dots, z\}$ the set of lower case letters.

Strings: A string is a finite sequence of symbols chosen from some alphabet

For example 01101 is a string from binary alphabet

$$\Sigma = \{0, 1\}$$

The empty string is the string with zero occurrence of symbols. This string is denoted by ϵ .

The length of the string is the number of positions for symbol in string. The standard notation for the length of string w is $|w|$. For example $|011| = 3$ and $|\epsilon| = 0$.

The power of the alphabet Σ is the set of all strings of certain length from that alphabet. Σ^k is used to define set of strings of length k . For example

$\Sigma = \{a, b, c\}$ then

$$\Sigma^0 = \epsilon$$

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Dayananda Sagar College of Engineering

Bangalore - 560 073

$$\Sigma^1 = \{a, b, c\}$$

$$\Sigma^2 = \{aa, ab, ac, ba, bb, bc, ca, cb, cc\}$$

Σ^* is used to represent set of strings over alphabet

Σ including null. So $\Sigma^* = \Sigma^0 \cup \Sigma^1 \cup \Sigma^2 \cup \Sigma^3 \dots \cup \{\epsilon\}$

Σ^+ is used to represent set of all strings over alphabet Σ excluding null. So $\Sigma^+ = \Sigma^1 \cup \Sigma^2 \cup \Sigma^3 \dots$

Concatenation of strings in two strings one combined together to form single string. For example

Let $x = 1101$ and $y = 0011$. Then $xy = 11010011$

Languages: A set of strings, all of which are chosen from Σ^* where Σ is set of s/p symbols is called alphabet. If Σ is an alphabet, and $L \subseteq \Sigma^*$, then L is a language over Σ . The language is collection of appropriate strings of alphabet.

For example (i) $\Sigma = \{ \epsilon, 0, 00, 000, \dots \}$

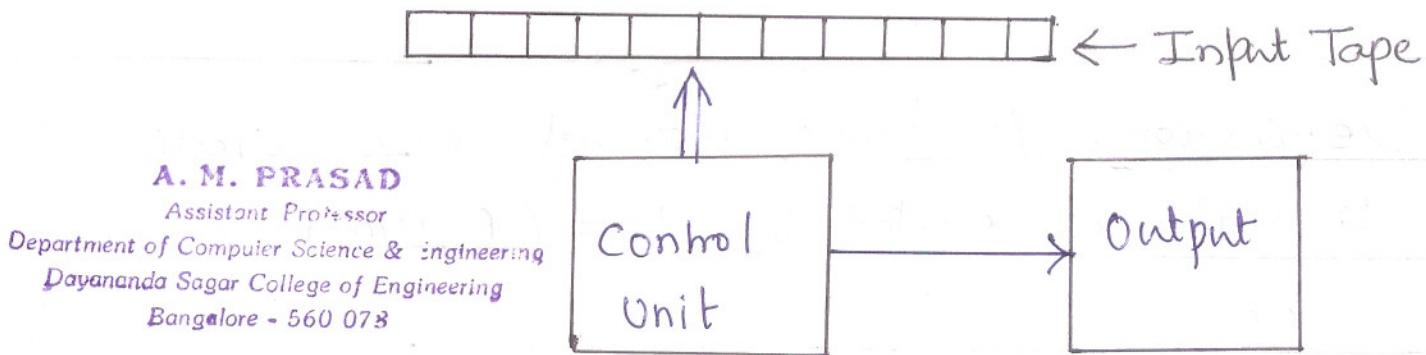

Here the language L is defined by any number of zeros.

(ii) $\Sigma = \{ \epsilon, 01, 10, 0011, 0101, 1001, \dots \}$

Here the language L is defined by set of strings of 0's and 1's with equal number of each.

FINITE AUTOMATA

A finite automaton is a mathematical or theoretical model which is used to study the abstract computing devices with inputs chosen from Σ , set of input symbols called alphabet. The machine may accept or reject string. Finite automaton is an abstract model of a digital computer represented as given below.

The three components of Finite Automata are

i) Input tape : The tape divided into cells each of which can hold one input symbol. The string to be processed is stored in this tape.

ii) Control Unit : The control decides the next state on receiving particular input from input tape. (6)

iii) Output : Output may be accepted or rejected

The notations used in finite automata design

one

○ Circle represent initial state or intermediate state

→ represents transition

○ two concentric circles represents final state

Definition: A finite automata is a collection of 5-tuple represented by $M = (Q, q_0, F, \Sigma, \delta)$

where

Q = set of states $\{q_0, q_1, q_2, \dots\}$

q_0 = Unique initial state

F = set of final states

Σ = set of input symbols

δ = transitions represented by table.

The transition function δ is defined as

$\delta: Q \times \Sigma \rightarrow Q$

i.e. $\delta(q_0, a) = q_1$

q_0 is current state, a is input symbol and q_1 is resultant state.

From the transition table, the automaton can be represented diagrammatically, called as

Transition diagram.

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

Types of Finite Automata

Based on the principle of transition on current input symbol from one state to other, Finite Automaton is differentiated as

- i) Deterministic Finite Automata
- ii) Non deterministic finite Automata
- iii) Non deterministic finite Automata with E moves

DETERMINISTIC FINITE AUTOMATA (DFA)

In DFA, there is exactly one transition for every input symbol from state. So it is possible to determine exactly to which state the machine enters after processing input symbol.

The DFA is defined as 5-tuple represented by $M = (Q, \Sigma, q_0, F, \delta)$ where

Q is set of states $\{q_0, q_1, \dots, q_n\}$

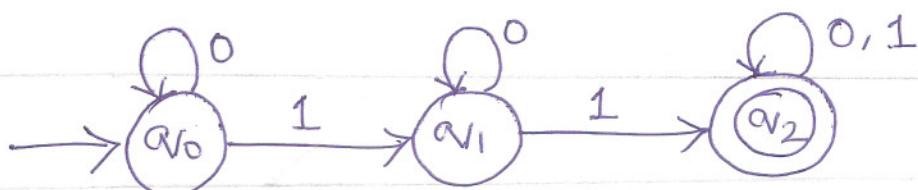

Σ is set of input symbols

q_0 is initial state

F is set of final states

δ is transition function

Consider the following transition diagram

In the above transition diagram, we can observe on given input symbol there is only one transition in all the transitions.

The transition table is

State	0	1
q_0	q_0	q_1
q_1	q_1	q_2
q_2	q_2	q_2

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Dayananda Sagar College of Engineering

Bangalore - 560 073

In transition table also we can observe, on given 0/p symbol there is only one transition. So next state is determined.

Problems.

1. Design DFA which accepts the string ending with 00 over the $\Sigma = \{0, 1\}$.

Ans: DFA to accept the string ending with 00.

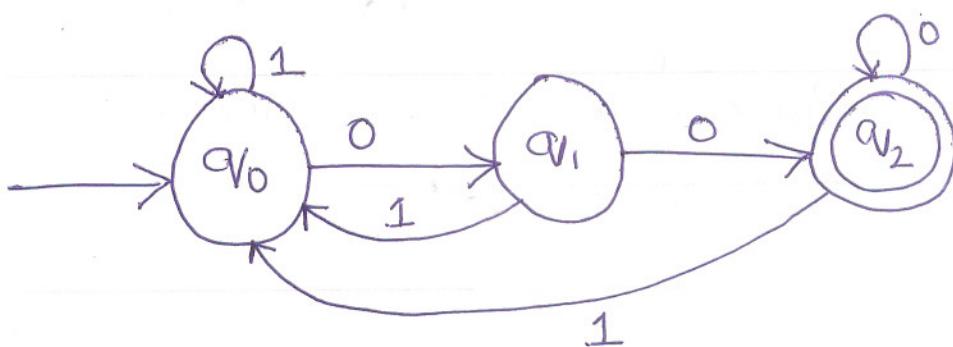

Eg: 100, 000, 1100, 1000 etc.

The minimum string is 00. First write DFA which accepts only minimum string 00.

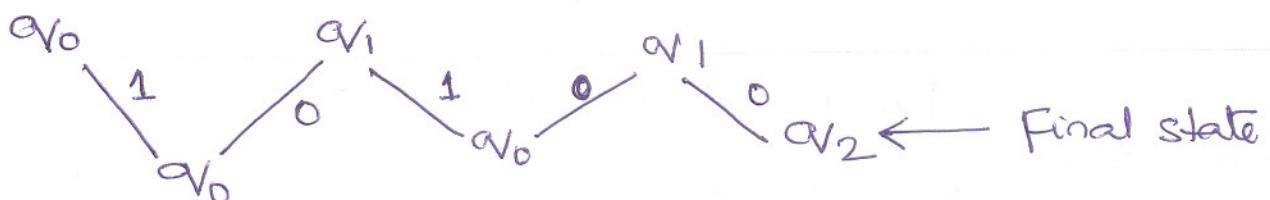

Now, start adding rest of the transition according to question in transition table.

State	0	1
$\rightarrow q_0$	q_1	q_0
q_1	q_2	q_0
* q_2	q_2	q_0

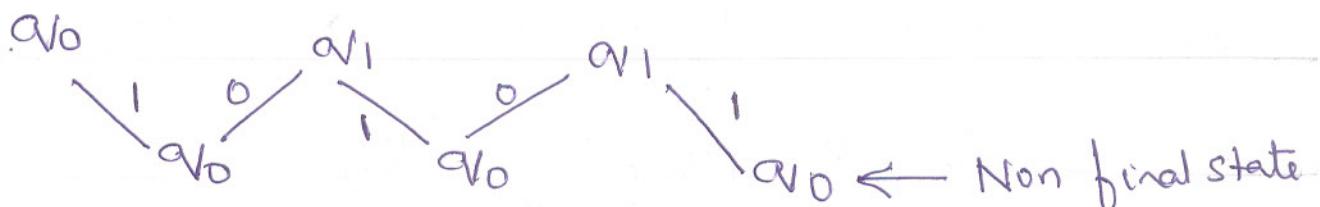

Consider the string 10100, the transitions are

After all transitions, the last state is q_2 . The q_2 is final state. Therefore string is accepted.

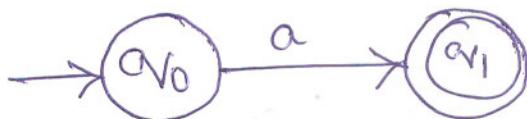

Consider the string 10101, the transitions are

Since q_0 is nonfinal state, the string is not accepted. 11

2. Draw DFA to accept string of a's and b's having at least one a.

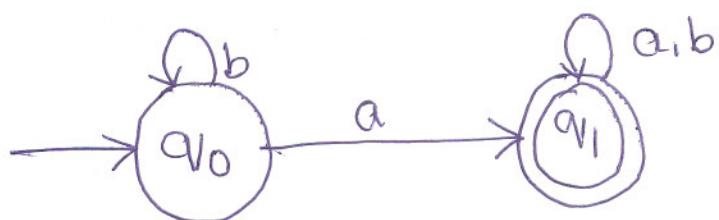

Ans: DFA having atleast one a. The minimum string is a. Draw DFA for only a

Now start adding rest of transitions.

State	a	b
$\rightarrow q_0$	q_1	q_0
* q_1	q_1	q_1

A. M. PRASAD
Assistant Professor
Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

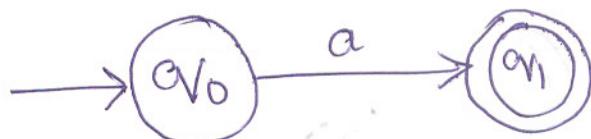

Consider the string babb

Consider the string bbb.

3. Draw DFA to accept string of a's & b's having exactly one a.

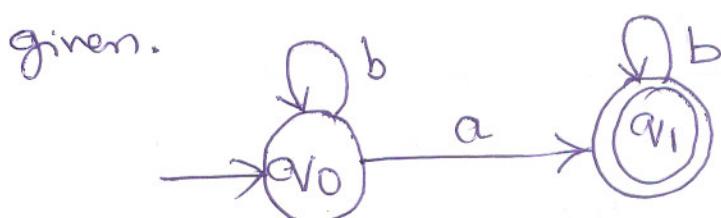

Ans: DFA to accept exactly one 'a'. The minimum string is a. Draw DFA for one a

Now add rest of the transition.

state	a	b
q0	q1	q0
q1	\emptyset	q1

We can observe q_1 on b transition cannot be given.

Consider abb

Consider aab

4. Design DFA which accepts those strings that starts with 1 and ends with 0.

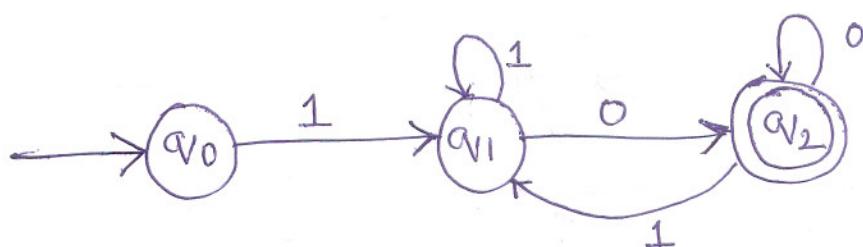

Ans: The minimum string is 10. Draw DFA for 10

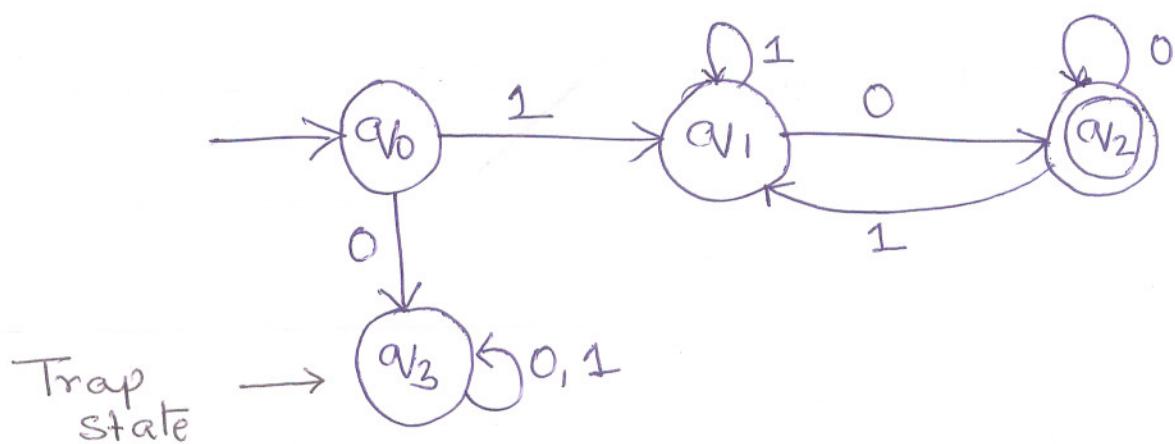

Add rest of the transitions one after the other

State	0	1
$\rightarrow q_0$	\emptyset	q_1
q_1	q_2	q_1
$* q_2$	q_2	q_1

A. M. PRASAD
Assistant Professor
Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

Here we can observe $S(q_0, 0)$ is not possible. In this situation we can create one trap state and give the transitions to trap state. But it is optional

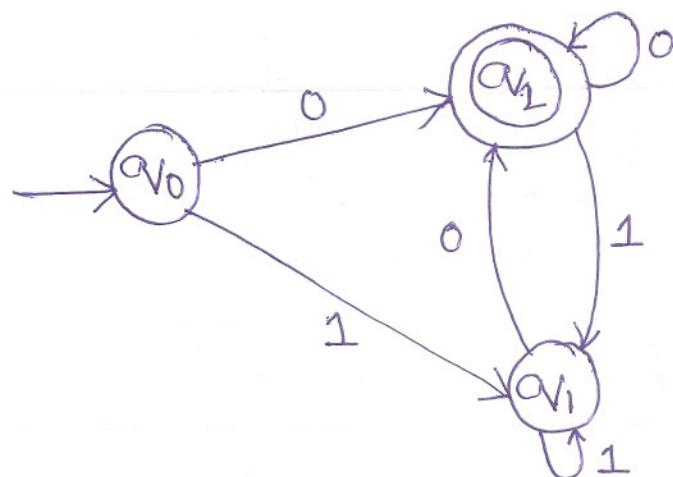

Consider the string 100010

Consider the string 10011

5. Design DFA which checks whether the given binary number is even.

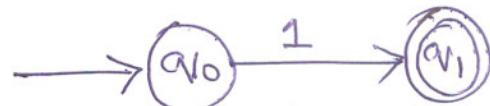

Ans: The minimum string is 0, 10, 100

State	0	1
$\rightarrow q_0$	q_2	q_1
q_1	q_2	q_1
*	q_2	q_1

6. Design DFA which accepts odd number of 1's and any no of 0's

Ans: The minimum string is 1

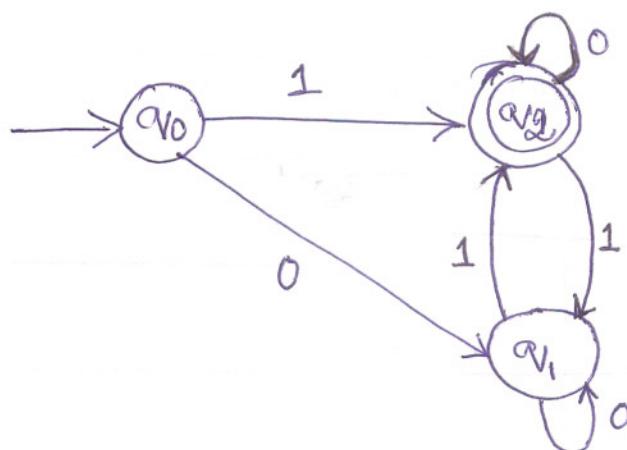

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

Add rest of the transitions later

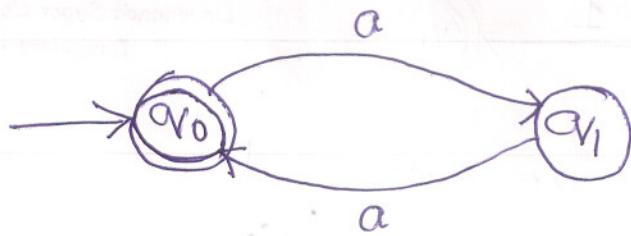

state	0	1
$\rightarrow q_0$	q_1	q_2
q_1	q_1	q_2
* q_2	q_2	q_1

7. Draw DFA to accept even number of a's over Σ_a

Ans: Since it is even number of a's (any even no.)

In this type of problem, DFA should have loops.

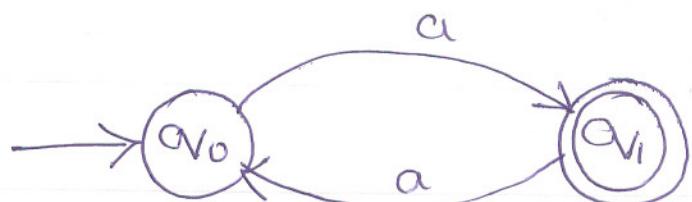

The transition table is

State	a
q_0	q_1
q_1	q_0

8. Draw DFA to accept odd number of a's

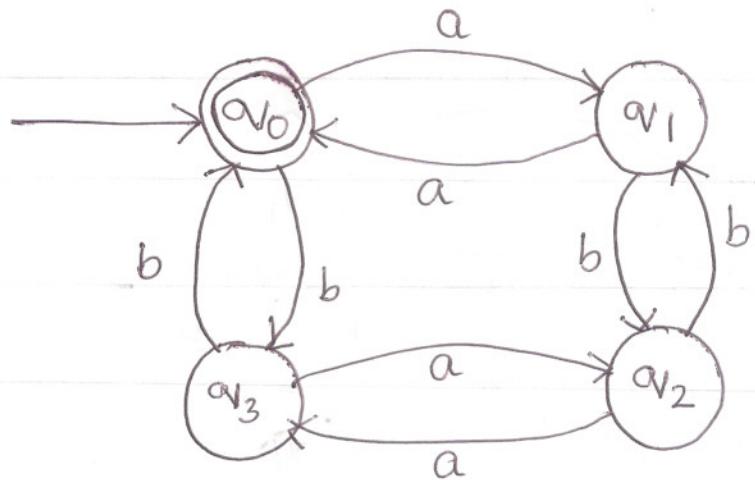

Ans:

State	a
q_0	q_1
q_1	q_0

9. Draw DFA to accept even number of a's and even number of b's.

Ans:

A. M. PRASAD

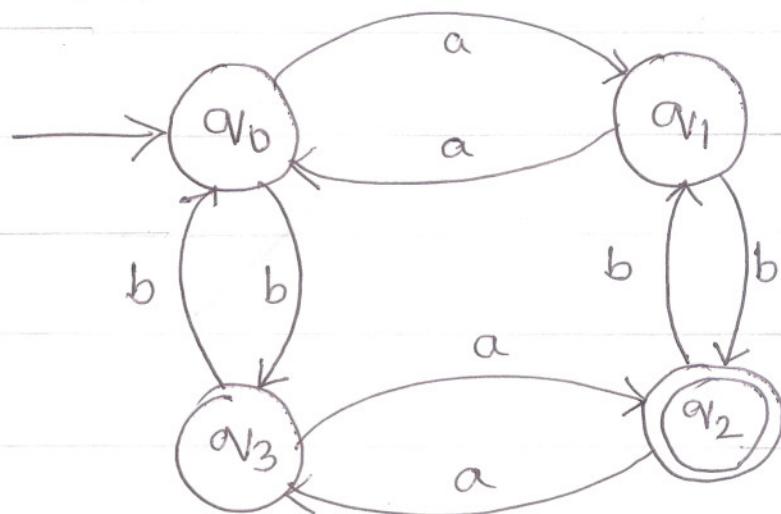

Assistant Professor

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

State	a	b
q_0	q_1	q_3
q_1	q_0	q_2
q_2	q_3	q_1
q_3	q_2	q_0

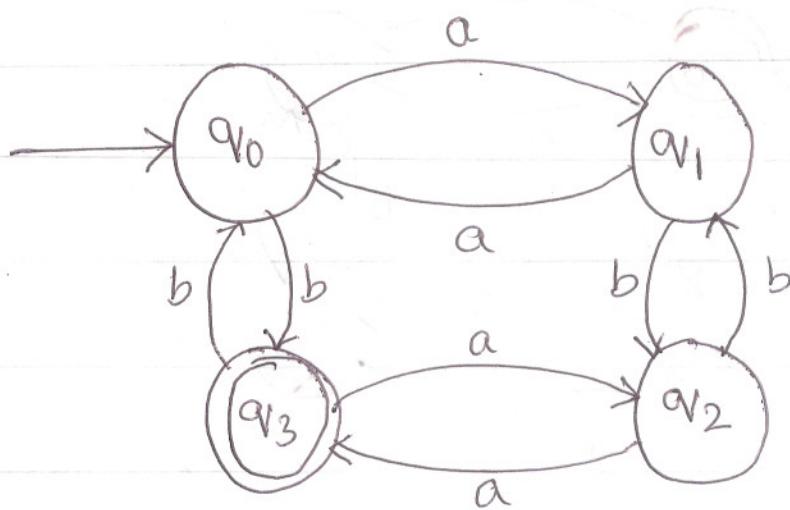

10. Draw DFA to accept odd no of a's and odd no of b's.

Ans:

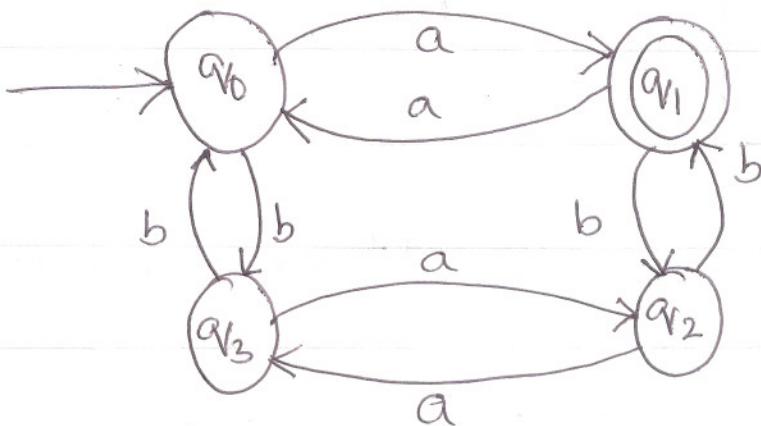

11. Draw DFA to accept even number of a's and odd number of b's.

Ans

12. Draw DFA to accept odd number of a's and even number of b's

Ans

13. Obtain a DFA to accept the language

$$L = \{ w; |w| \bmod 3 = 0 \} \text{ over } \Sigma a$$

Ans:

Language $L = \{ w, |w| \bmod 3 = 0 \}$ in

$|w|$, length of the word $\bmod 3 = 0$

Example

$$0 \div 3 = 0$$

$$3 \bmod 3 = 0$$

$$1 \bmod 3 = 1$$

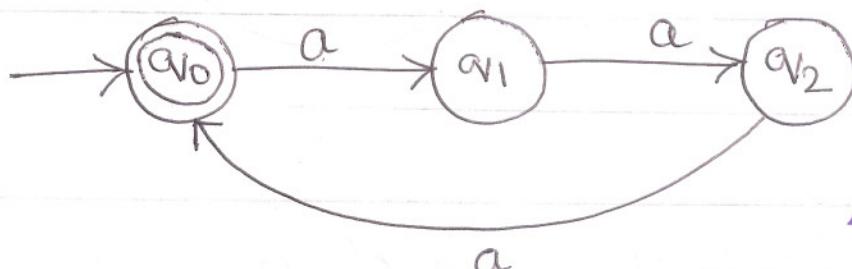

$$4 \bmod 3 = 1$$

$$2 \bmod 3 = 2$$

$$5 \bmod 3 = 2 \text{ soon}$$

The DFA should accept 0 a and multiple of 3.

The automata is

A. M. PRASAD

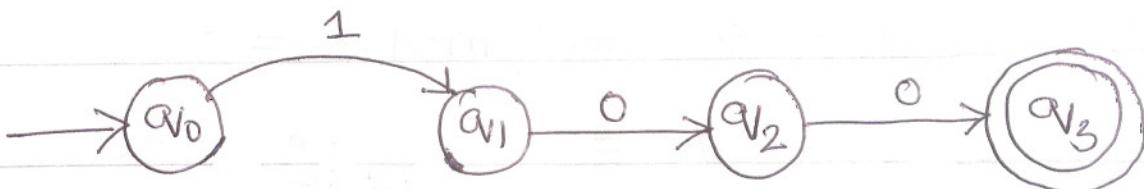

Assistant Professor

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 073

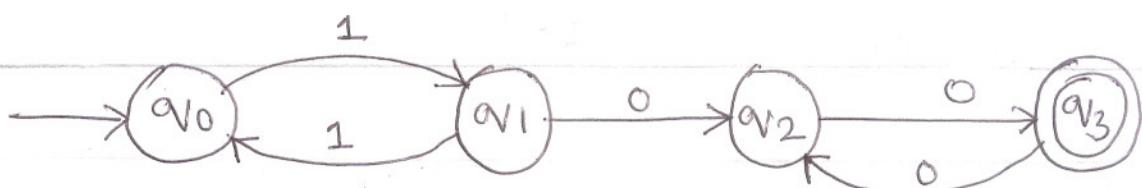

State	a
q_0	q_1
q_1	q_2
q_2	q_0

14. Draw a DFA to accept the language odd no. of 1's followed by even number of 0's. $\Sigma = \{0, 1\}$

Ans: The minimum string is 100.

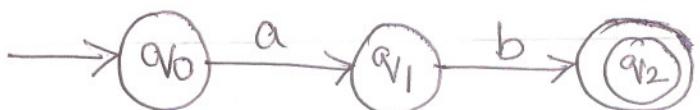

by making loops, DFA accepts any odd number of 1's and even 0's.

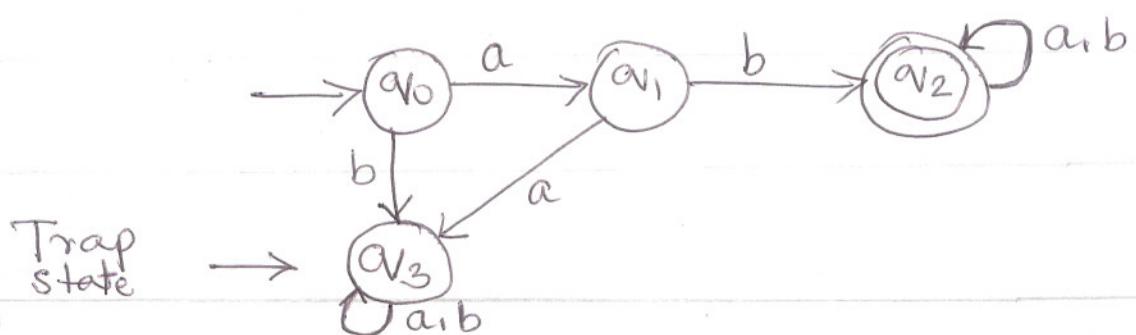

15. Obtain DFA to accept string of a's & b's starting with the string ab.

Ans: The minimum string is ab. The DFA for ab is

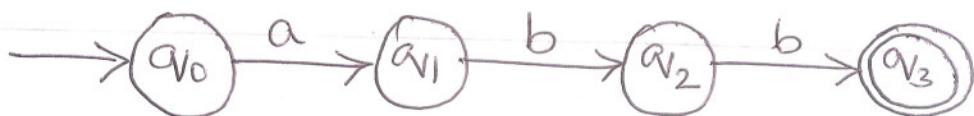

The q2 can have both transition to itself

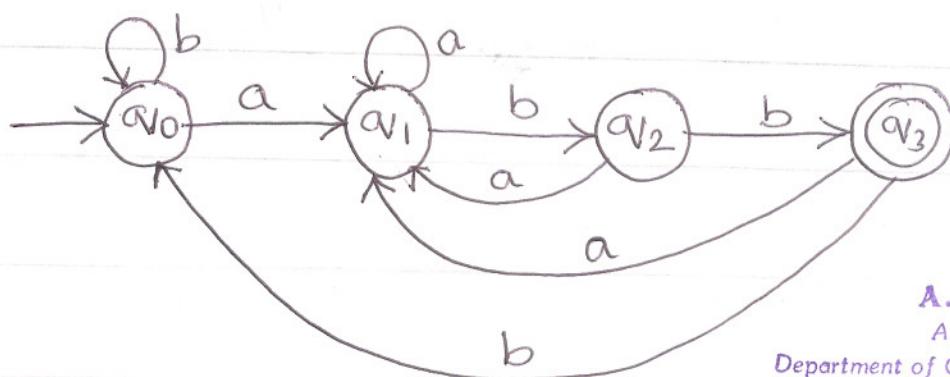

16. Draw a DFA to accept string of a's & b's ending with the string abb.

Ans: The minimum string is abb. Draw DFA to accept abb only

Now add new transitions according to question

A. M. PRASAD

Assistant Professor

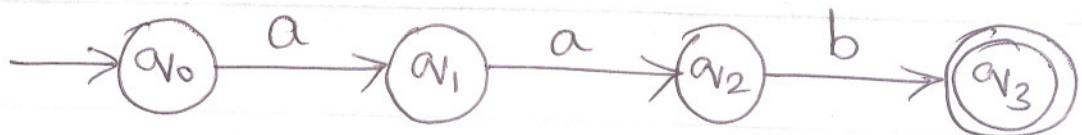

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

State	a	b
$\rightarrow q_0$	q_1	q_0
q_1	q_1	q_2
q_2	q_1	q_3
* q_3	q_1	q_0

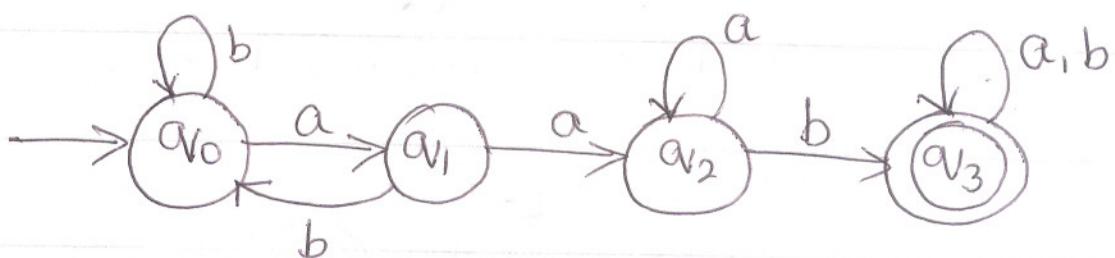

17. Draw a DFA to accept string of a's & b's having a substring aab.

Ans:

The minimum string is aab

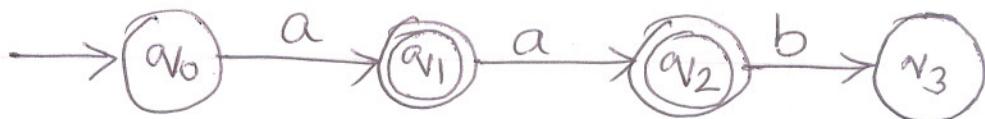

Add rest of the transitions

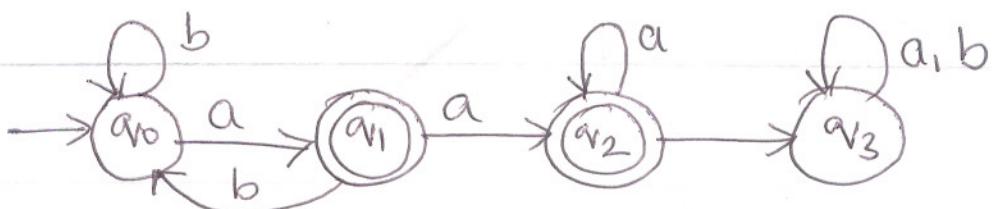

18. Draw DFA to accept string of a's & b's except those having substring aab

Ans: Minimum string is aab. Draw DFA for aab, and don't make last state as final

Add rest of the transitions, according to question

19. Construct DFA which accepts string of 0's and 1's

where each string is represented as binary number,

$$L = \{ w, w \bmod 5 = 0, \Sigma = \{0, 1\} \}$$

Ans: For these problems, transition can be obtained

using the formula

$$\delta(\alpha_i, a) = \alpha_j \quad \text{where } j = (2*i + d) \bmod k$$

↗ *a/p symbol*
 ↗ radix ↗ remainder ↗ divisor

$$d = \{0, 1\}$$

$$r = 2$$

$$i = 0, 1, 2, 3, 4$$

$$k = 5$$

A. M. PRASAD

Assistant Professor

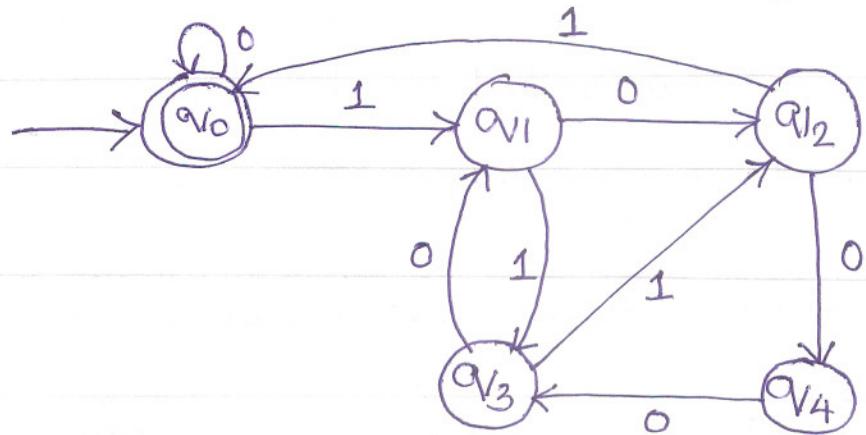

Department of Computer Science & Engineering

Dayananda Sagar College of Engineering

Bangalore - 560 078

Remainder	d	$(2*i + d) \bmod 5$	$\delta(\alpha_i, d) = \alpha_j$
i=0	0	$(2*0+0) \bmod 5 = 0$	$\delta(\alpha_0, 0) = \alpha_0$
	1	$(2*0+1) \bmod 5 = 1$	$\delta(\alpha_0, 1) = \alpha_1$
i=1	0	$(2*1+0) \bmod 5 = 2$	$\delta(\alpha_1, 0) = \alpha_2$
	1	$(2*1+1) \bmod 5 = 3$	$\delta(\alpha_1, 1) = \alpha_3$
i=2	0	$(2*2+0) \bmod 5 = 4$	$\delta(\alpha_2, 0) = \alpha_4$
	1	$(2*2+1) \bmod 5 = 0$	$\delta(\alpha_2, 1) = \alpha_0$
i=3	0	$(2*3+0) \bmod 5 = 1$	$\delta(\alpha_3, 0) = \alpha_1$
	1	$(2*3+1) \bmod 5 = 2$	$\delta(\alpha_3, 1) = \alpha_2$
i=4	0	$(2*4+0) \bmod 5 = 3$	$\delta(\alpha_4, 0) = \alpha_3$
	1	$(2*4+1) \bmod 5 = 4$	$\delta(\alpha_4, 1) = \alpha_4$

Now, write the transition diagram for these transitions

State	0	1
q_0	q_0	q_1
q_1	q_2	q_3
q_2	q_4	q_0
q_3	q_1	q_2
q_4	q_3	q_4

20. Draw DFA to accept string divisible by 3, $\Sigma = \{0, 1\}$

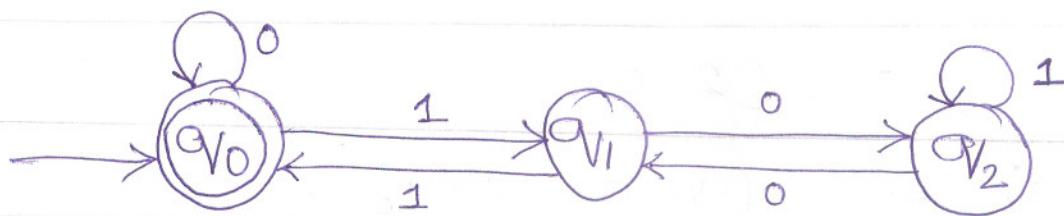

Ans: The transitions are obtained by relation divisor

$$\delta(q_i, a) = q_j, q_j = (2*i + d) \bmod k$$

↑ divisor
↓ radix ↓ remainder ↓ q/p

Remainder	d	$(2*i + d) \bmod 3$	$(q_i, d) = q_j$
$i=0$	0	$(2*0 + 0) \bmod 3 = q_0$	$(q_0, 0) = q_0$
	1	$(2*0 + 1) \bmod 3 = q_1$	$(q_0, 1) = q_1$
$i=1$	0	$(2*1 + 0) \bmod 3 = q_2$	$(q_1, 0) = q_2$
	1	$(2*1 + 1) \bmod 3 = q_0$	$(q_1, 1) = q_0$
$i=2$	0	$(2*2 + 0) \bmod 3 = q_1$	$(q_2, 0) = q_1$
	1	$(2*2 + 1) \bmod 3 = q_2$	$(q_2, 1) = q_2$

Now, draw transition diagram using these transitions

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

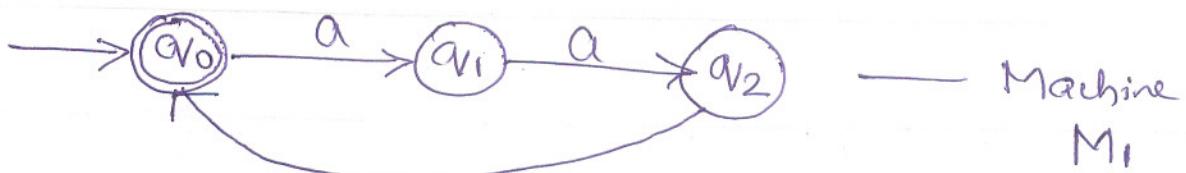

Dayananda Sagar College of Engineering

Bangalore - 560 078

21. Obtain DFA to accept the following

$$L = |w| \bmod 3 \geq |w| \bmod 2 \text{ over } \Sigma^a$$

Ans: First, design DFA for $|w| \bmod 3$

$$Q_1 = \{Q_0, Q_1, Q_2\}$$

Next, design DFA for $|w| \bmod 2$

$$Q_2 = \{Q_0, Q_1\}$$

Now compute $Q_1 \times Q_2$

I Machine
M₁

II Machine
M₂

$$\delta((Q_0, Q_0)a) = \delta(Q_0, a), \delta(Q_0, a)$$

$$= Q_1, Q_1$$

$$= (1, 1) \text{ consider Subscript}$$

$$\begin{aligned}\delta((\alpha_1, \alpha_1)a) &= \delta(\alpha_1, a), \delta(\alpha_1, a) \\ &= \alpha_2, \alpha_0 \\ &= (2, 0)\end{aligned}$$

$$\begin{aligned}\delta((\alpha_2, \alpha_0)a) &= \delta(\alpha_2, a), \delta(\alpha_0, a) \\ &= \alpha_0, \alpha_1 \\ &= (0, 1)\end{aligned}$$

$$\begin{aligned}\delta((\alpha_0, \alpha_1)a) &= \delta(\alpha_0, a), \delta(\alpha_1, a) \\ &= \alpha_1, \alpha_0 \\ &= (1, 0)\end{aligned}$$

$$\begin{aligned}\delta((\alpha_1, \alpha_0)a) &= \delta(\alpha_1, a), \delta(\alpha_0, a) \\ &= \alpha_2, \alpha_1 \\ &= (2, 1)\end{aligned}$$

$$\begin{aligned}\delta((\alpha_2, \alpha_1)a) &= \delta(\alpha_2, a), \delta(\alpha_1, a) \\ &= \alpha_0, \alpha_0 \\ &= (0, 0)\end{aligned}$$

The set is

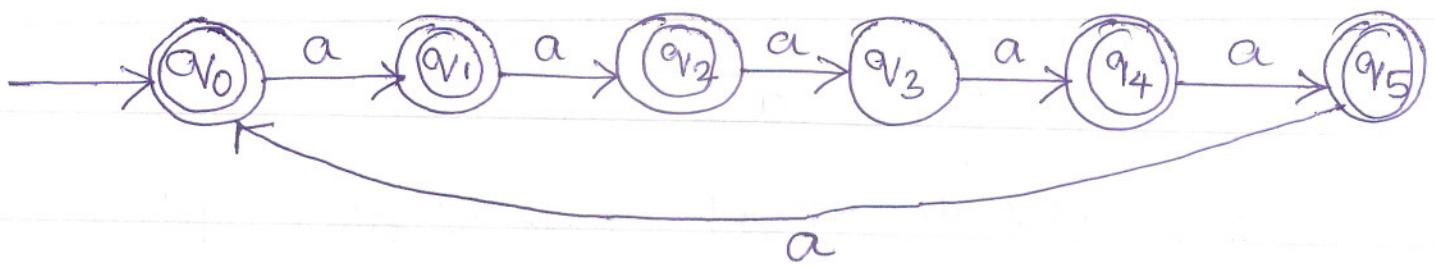

$$F = \{(0,0), (1,1), (2,0), (1,0), (2,1), (0,1)\}$$

$$|w| \bmod 3 \geq |w| \bmod 2$$

In the set, select the pair where I value \rightarrow II value for final state

(27)

$$\text{So, } F = \{(0,0)(1,1)(2,0)(1,0)(2,1)\}$$

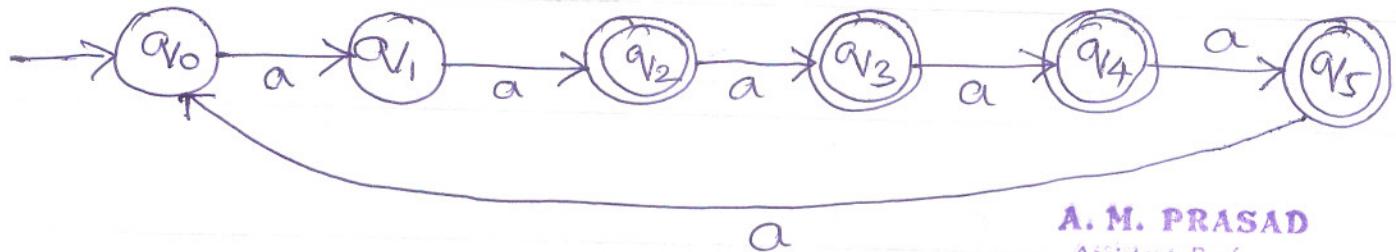

22. Obtain DFA to accept the language

$$L = \{ |w| \bmod 3 \neq |w| \bmod 2, \Sigma = a \}$$

Ans: Repeat the same procedure of problem 21.

In set F, select the pair where first value is not equal to second value. as final states

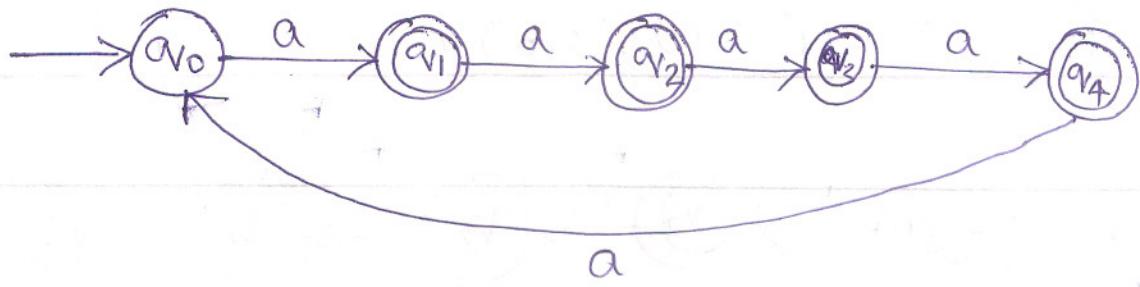

$$= \{ (2,0), (0,1), (1,0), (2,1) \}$$

A. M. PRASAD
Assistant Professor
Department of Computer Science & Engineering
Dayananda Sagar College of Engineering.
Fengate, 560 078

23. Obtain DFA to accept $L = \{ w : |w| \bmod 5 \neq 0 \}$

Ans: The remainders of $|w| \bmod 5 = 0, 1, 2, 3, 4$, make states 1, 2, 3, 4 as final states in $|w| \bmod 5 = 0$

24. Obtain DFA to accept string of a's & b's

Such that $L = \{ w \mid Na(w) \bmod 3 = 0 \text{ and } Nb(w) \bmod 2 = 0 \}$

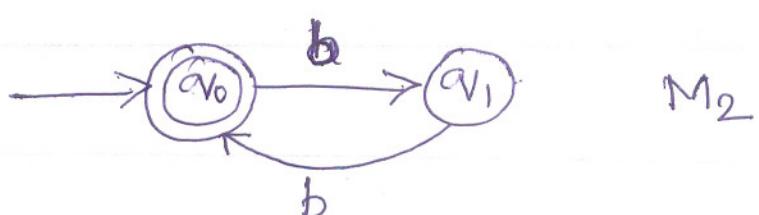

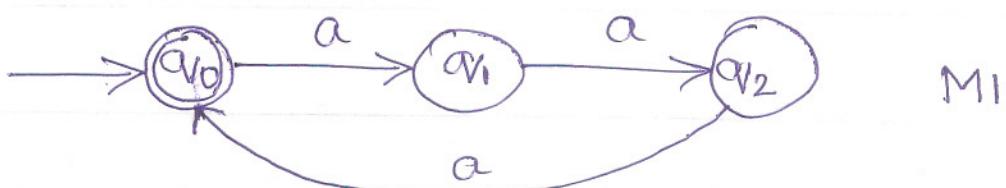

Ans:

$Na(w) \bmod 3$, the remainders are 0, 1, 2

$Nb(w) \bmod 2$, the remainders are 0, 1

(A_0, A_1, A_2) (B_0, B_1) are states of I & II m/e.

$$Q_1 \times Q_2 = (A_0, B_0) (A_0, B_1) (A_1, B_0) (A_1, B_1)$$

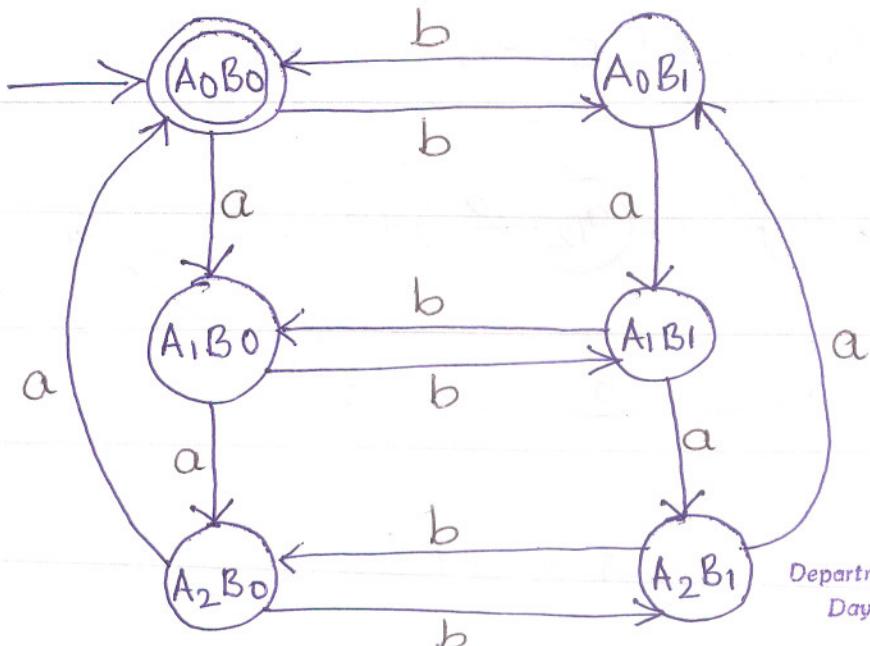

$$\delta(A_0, a) = A_1$$

$$\delta(B_0, b) = B_1$$

$$\delta(A_1, a) = A_2$$

$$\delta(B_1, b) = B_0$$

$$\delta(A_2, a) = A_0$$

A. M. PRASAD
 Assistant Professor
 Department of Computer Science & Engineering
 Dayananda Sagar College of Engineering
 Bangalore - 560 078

25. Obtain DFA to accept string of a's and b's

such that $N_a(w) \bmod 5 = 0$ and $N_b(w) \bmod 3 = 0$

Ans. $N_a(w) \bmod 5 = 0$, the remainders 0, 1, 2, 3, 4

$$Q_1 = \{A_0, A_1, A_2, A_3, A_4\}$$

$N_b(w) \bmod 3 = 0$, the remainders 0, 1, 2

$$Q_2 = \{B_0, B_1, B_2\}$$

$$Q_1 \times Q_2 = \{ (A_0, B_0), (A_0, B_1), (A_0, B_2) \}$$

$$(A_1, B_0) (A_1, B_1) (A_1, B_2)$$

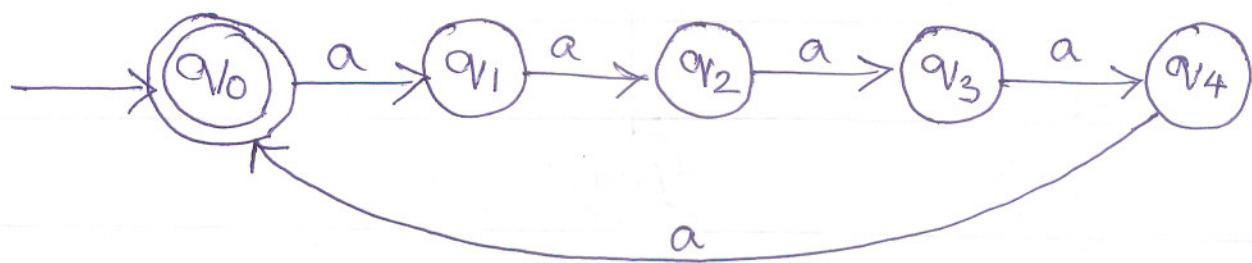

$$(A_2, B_0) (A_2, B_1) (A_2, B_2)$$

$$(A_3, B_0) (A_3, B_1) (A_3, B_2)$$

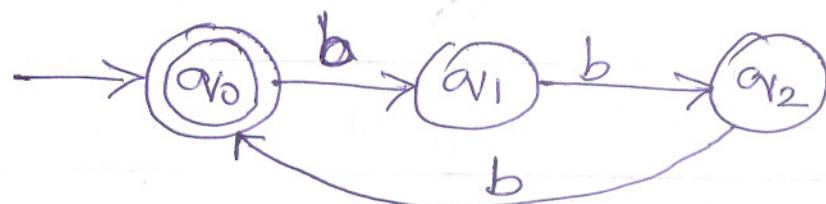

$$(A_4, B_0) (A_4, B_1) (A_4, B_2)$$

}

DFA for $N_{a(\omega)} \bmod 5 = 0$

DFA for $N_b(\omega) \bmod 3 = 0$

$$\delta(q_0, a) = q_1 - A_0$$

$$\delta(q_0, b) = q_1 - B_0$$

$$\delta(q_1, a) = q_2 - A_1$$

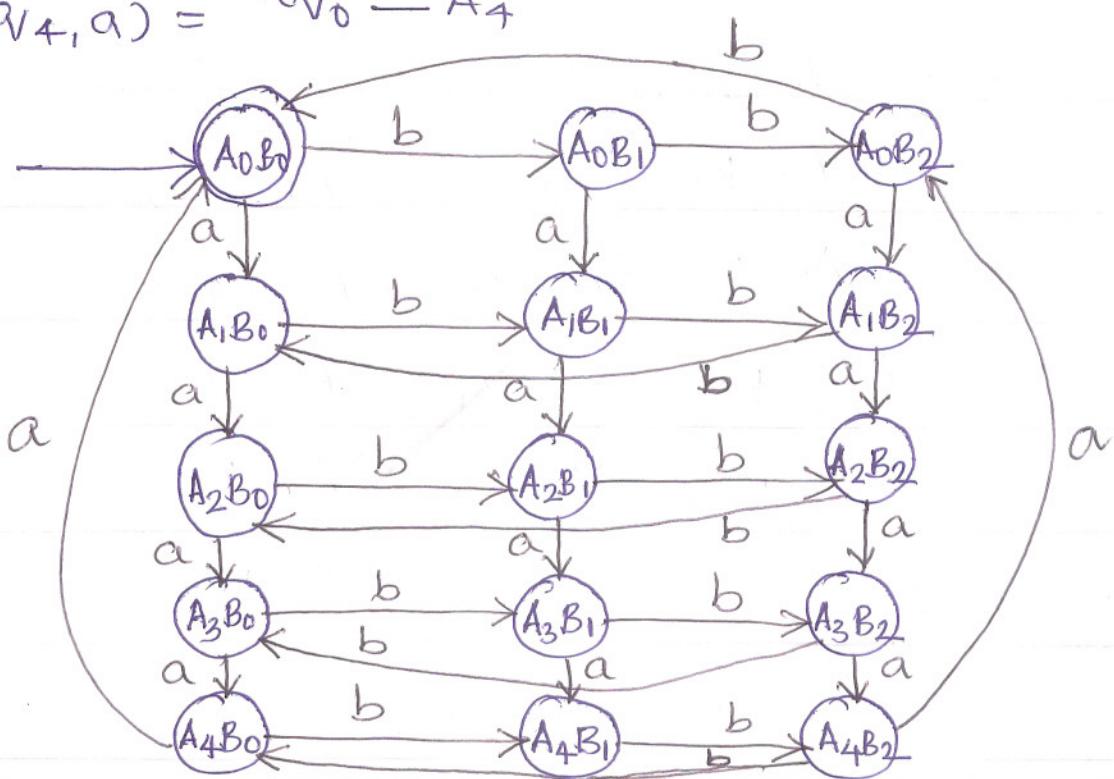

$$\delta(q_1, b) = q_2 - B_1$$

$$\delta(q_2, a) = q_0 - A_2$$

$$\delta(q_2, b) = q_0 - B_2$$

$$\delta(q_3, a) = q_4 - A_3$$

$$\delta(q_4, a) = q_0 - A_4$$

26. Construct DFA to accept the following language

$$L = \{ w : n_a(w) \bmod 5 \neq n_b(w) \bmod 3 \}$$

Ans:

Same as previous problem, but while deciding final state, select the state where both ^{of} are not same subscript. Eg A₁, B₂

Subscript.

27. Construct DFA to accept the following language

$$L = \{ w : n_a(w) \bmod 5 > n_b(w) \bmod 3 \}$$

Ans:

Same as problem 25. But the final states are those pair in which subscript of A greater than subscript of B. Eg: A₄, B₁

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Dayananda Sagar College of Engineering

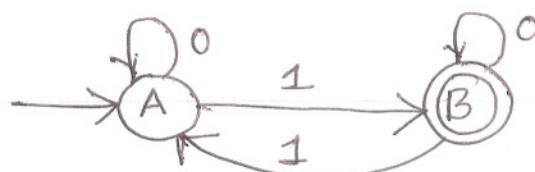

Bangalore - 560 078

28. Consider the DFA

δ	0	1
\rightarrow	A	B
*	B	A

Informally describe the language accepted by DFA.

Ans. The transition diagram is

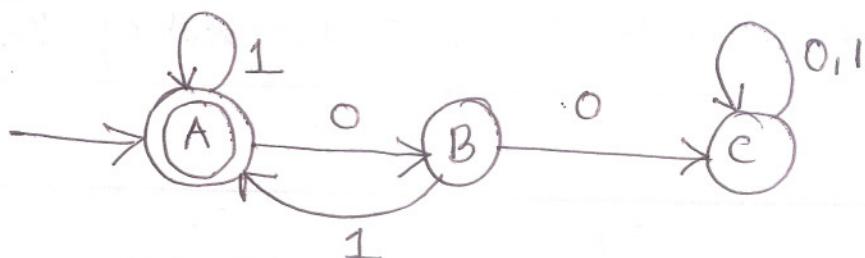

In the diagram we can observe the DFA accepts odd number of 1's with any number of 0's. So the given DFA accepts string 0's and 1's with odd number of 1's.

29. Consider DFA with following transition table

δ	0	1
A	B	A
B	C	A
C	C	C

The diagram is

We can observe (i) the diagram accepts the string ending with 1 only.

(ii) the diagram accepts ϵ

(iii) can have consecutive 1's but not 0's.

Non deterministic Finite Automata (NFA)

The disadvantages of DFA are

- (i) DFA design is difficult
- (ii) Don't have power to be in several state at once.

The above disadvantages can be overcome by making NFA. The advantages of NFA are

- (i) Power to be in several state at once
- (ii) Very easy to construct
- (iii) Efficient mechanism to solve difficult problem.

Definition: The NFA is 5-tuple represented by

$$M = \{ Q, q_0, F, \Sigma, \delta \}$$

where

Q - set of states

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Dayananda Sagar College of Engineering

Bangalore - 560 078

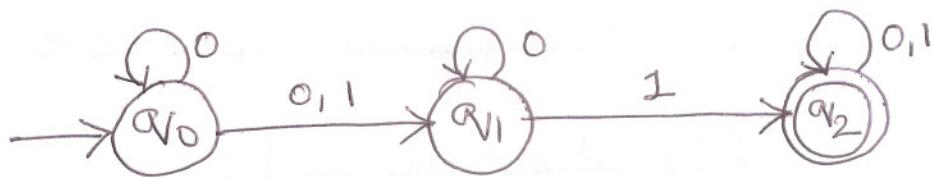

q_0 - unique initial state

F - set of final states

Σ - set of input symbols

δ - transition function represented as
transition table.

Consider the following transition diagram

The transition table for above diagram is

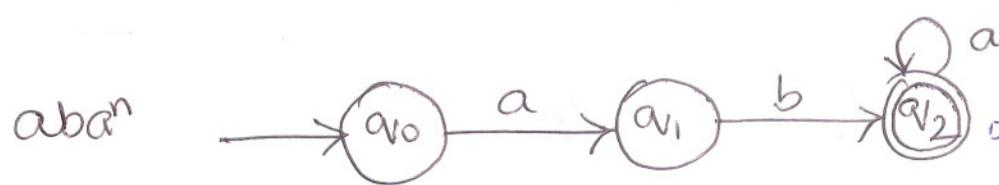

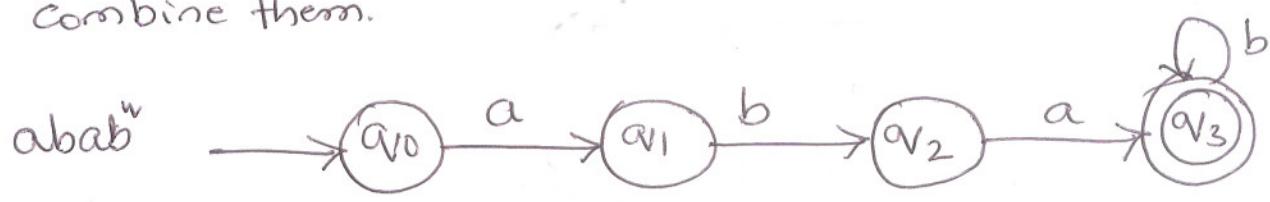

State	0	1
$\rightarrow q_0$	$q_0 q_1$	q_1
q_1	q_1	q_2
* q_2	q_2	q_2

In transition table / diagram, we can observe, on given i/p symbol 0, q_0 changes to q_0 and q_1 also. In finite Automata, if there are more than one transition on given i/p symbol, such machines are called Nondeterministic finite Automata.

Problems.

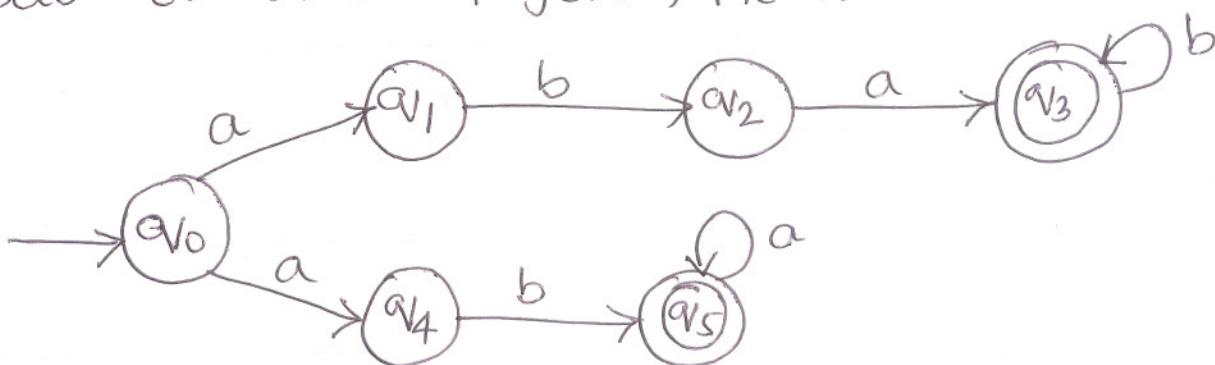

1. Obtain an NFA which accepts the following language $L = \{abab^n \text{ or } aban}^n, n \geq 0\}$

Solution:- The machine has to accept both $abab^n$ or $aban^n$. One approach is to design each separately and combine them.

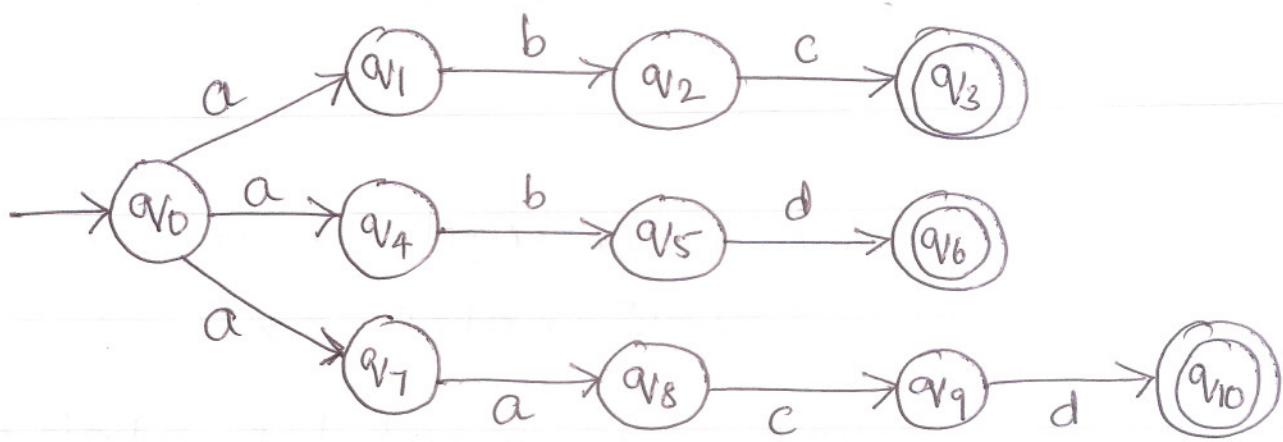

A. M. PRASAD
Assistant Professor
Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 073

ababⁿ or abanⁿ together, the machine is

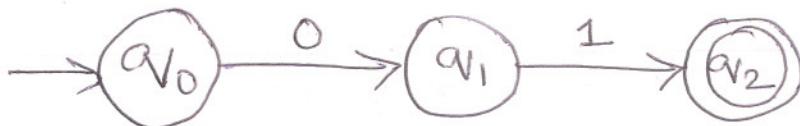

On input symbol 'a' q_0 changes to q_1 as well q_4 also. So it is NFA

2. Design NFA to accept the following strings
abc, abd, aacd.

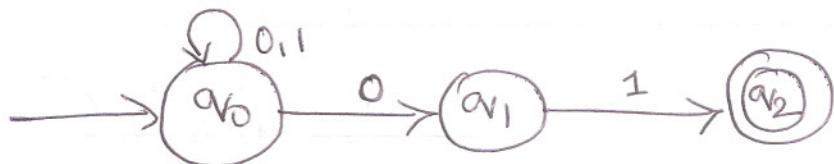

3. Design NFA which accepts all the strings ending with 01, over $\Sigma = \{0, 1\}$.

Soln: Draw automate for 01

Now add rest of the transitions.

Conversion of NFA to DFA

Using DFA only for some of the problems automaton can be constructed. For some problems DFA cannot be constructed. In this case, for those problems NFA can be constructed. But practically Nondeterministic machines will not exists. So NFA designed to be converted to DFA. The NFA can be converted to DFA using two methods.

(i) Subset construction method.

(ii) Lazy Evaluation.

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Dayananda Sagar College of Engineering

Bangalore - 560 078

Subset Construction Method

The subset construction starts from an NFA $N = (Q_N, \Sigma, \delta_N, q_0, F_N)$. Its goal is the description of a DFA $D = (Q_D, \Sigma, \delta_D, q_0, F_D)$ such that $L(D) = L(N)$. The components of D is constructed as follows.

(i) q_0 is start state of DFA, the q_0 is initial state of NFA also.

ii) The states of DFA, Q_D are the set of subsets of Q_N . So if Q_N has 'n' states then Q_D will have 2^n states.

iii) The final state of DFA are those states where the final state of NFA are present

Thus DFA can be obtained using subset construction method.

Problem: 1. Obtain DFA for the following NFA using Subset construction method.

Ans:

The states of DFA are subsets of states of NFA

$$Q_D = \{ \emptyset, \{q_0\}, \{q_1\}, \{q_2\}, \{q_0, q_1\}, \{q_0, q_2\}, \{q_1, q_2\}, \{q_0, q_1, q_2\} \}$$

Totally eight states

(i) For state \emptyset :

$$\delta(\emptyset, a) = \emptyset \quad \delta(\emptyset, b) = \emptyset$$

(ii) For state q_0 : $\delta(q_0, a) = \{q_0, q_1\}$ $\delta(q_0, b) = \{q_0\}$

(iii) For state q_1 : $\delta(q_1, a) = \emptyset$ $\delta(q_1, b) = \{q_2\}$

(iv) For state q_2 : $\delta(q_2, a) = \emptyset$ $\delta(q_2, b) = \emptyset$

(V) For state $\{q_0, q_1\}$: $\delta(\{q_0, q_1\}, a) = \{q_0, q_1\}$

$$\delta(\{q_0, q_1\}, b) = \{q_0, q_2\}$$

(VI) For state $\{q_0, q_2\}$: $\delta(\{q_0, q_2\}, a) = \{q_0, q_1\}$

$$\delta(\{q_0, q_2\}, b) = \{q_0\}$$

(VII) For state $\{q_1, q_2\}$: $\delta(\{q_1, q_2\}, a) = \emptyset$

$$\delta(\{q_1, q_2\}, b) = \{q_2\}$$

(VIII) For state $\{q_0, q_1, q_2\}$: $\delta(\{q_0, q_1, q_2\}, a) = \{q_0, q_1\}$

$$\delta(\{q_0, q_1, q_2\}, b) = \{q_0, q_2\}$$

state	a	b
\emptyset	\emptyset	\emptyset
$q_0 q_1$	$\{q_0, q_1\}$	q_0
q_1	\emptyset	q_2
q_2	\emptyset	\emptyset
$q_0 q_1$	$\{q_0, q_1\}$	$\{q_0, q_2\}$
$q_0 q_2$	$\{q_0, q_1\}$	$\{q_0\}$

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

The eight states are A, B, C, D, E, F, G, H.

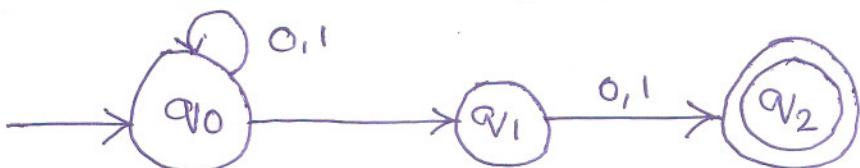

The transition table is

→

state	a	b
A	A	A
B	E	B
C	A	D
*	D	A
*	E	F
*	F	E
*	G	D
*	H	F

The states which are reachable from B are states of DFA, the states unreachable can be eliminated.

2. Convert the following NFA to DFA using subset construction method.

Ans: The states of the DFA are subsets of states of NFA $\{q_0, q_1, q_2\}$.

$\{\emptyset, q_0, q_1, q_2, \{q_0q_1\}, \{q_0q_2\}, \{q_1q_2\}, \{q_0q_1q_2\}\}$

Now, write the transitions for all subsets

- i) $\delta(\phi, 0) = \phi$ $\delta(\phi, 1) = \phi$
ii) $\delta(v_0, 0) = v_0$ $\delta(v_0, 1) = v_0v_1$
iii) $\delta(v_1, 0) = v_2$ $\delta(v_1, 1) = v_2$
iv) $\delta(v_2, 0) = \phi$ $\delta(v_2, 1) = \phi$
v) $\delta(v_0v_1, 0) = v_0v_2$ $\delta(v_2, 1) = v_0v_1v_2$
vi) $\delta(v_0v_2, 0) = v_0$ $\delta(v_0v_2, 1) = v_0v_1$
vii) $\delta(v_1v_2, 0) = v_2$ $\delta(v_1v_2, 1) = v_2$
viii) $\delta(v_0v_1v_2, 0) = v_0v_2$ $\delta(v_0v_1v_2) = v_0v_1v_2$

The eight states are A, B, C, D, E, F, G, H respectively

δ	0	1
A	A	A
B	B	E
C	D	D
*D	A	A
E	F	H
*F	B	E
*G	D	D
*H	F	H

A. M. PRASAD
Assistant Professor
Department of Computer Science & Engineering
Dayananda Sagar College of Engineering
Bangalore - 560 078

Of these states only reachable states are B, E, F & H.
The other four states are not accessible and can be ignored.

CONVERSION FROM NFA TO DFA USING LAZY EVALUATION METHOD.

In Subset construction method there are 2^n states and from each state we have the transition from input symbol in Σ and hence the time complexity to convert an NFA to DFA is $\Sigma * 2^n$.

Since the time complexity is exponential, the procedure takes very long time to construct the table. This exponential time complexity can be avoided using this technique called "Lazy Evaluation" on the Subsets.

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Bangalore - 560 078

ALGORITHM :

Given an NFA $M_N = (Q_N, \Sigma, \delta_N, q_0, F_N)$ which accepts the language $L(M_N)$, we can find an equivalent DFA $M_D = (Q_D, \Sigma, \delta_D, \{q_0\}, F_D)$ such that $L(M_D) = L(M_N)$

Proof :

Step 1 : Identify the start state of DFA : $\{q_0\}$ is the start state of DFA.

Step 2 : Identify the alphabets of DFA : The input alphabets of DFA are the input alphabets of NFA. So, $\Sigma = \{a, b\}$

Step 3 : Identify the transition of DFA : for each state $\{q_i, q_j, \dots, q_k\}$ in Q_D and for each input symbol a in Σ , the transition can be

Obtained as shown below :

$$\begin{aligned}\delta_D(\{q_i, q_j, \dots, q_k\}, a) &= \delta_N(q_i, a) \cup \delta_N(q_j, a) \cup \dots \cup \delta_N(q_k, a) \\ &= [q_e, q_m, \dots, q_n]\end{aligned}$$

- Add the state $[q_e, q_m, \dots, q_n]$ to Q_D , if it is not already in Q_D .
- Add the transition from $[q_i, q_j, \dots, q_k]$ to $[q_e, q_m, \dots, q_n]$ on the input symbol a .

Step 4 : Identify the final states of DFA : If $\{q_i, q_j, \dots, q_k\}$ is a state in Q_D and if one of q_i, q_j, \dots, q_k is the final state of NFA, then $\{q_i, q_j, \dots, q_k\}$ will be the final state of DFA.

EXAMPLE :

SOLⁿ : The transition table for the above DFA can be written as

δ	a	b
$\rightarrow q_0$	$\{q_0, q_1\}$	$\{q_0\}$
q_1	\emptyset	$\{q_2\}$
$* q_2$	\emptyset	\emptyset

Step 1: Identify the start state of DFA : $\{q_0\}$

Step 2: Identify the alphabets of DFA : $\Sigma = \{a, b\}$

Step 3: Identify the transition of DFA, start from the start state q_0

and find the transition as shown below,

For state $\{q_0\}$:

$$\text{Input symbol} = a ; \delta(q_0, a) = \{q_0, q_1\}$$

$$\text{Input symbol} = b ; \delta(q_0, b) = \{q_0\}$$

For state $\{q_0, q_1\}$:

$$\begin{aligned}\text{Input symbol} = a ; \delta(\{q_0, q_1\}, a) &= \delta(\{q_0, q_1\}, a) \\ &= \delta(q_0, a) \cup \delta(q_1, a) \\ &= \{q_0, q_1\} \cup \emptyset \\ &= \{q_0, q_1\}\end{aligned}$$

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering
Dattatreya Singh College of Engineering
Bhopal - 360 073

$$\text{Input symbol} = b ; \delta(\{q_0, q_1\}, b) = \delta(\{q_0, q_1\}, b)$$

$$= \delta(q_0, b) \cup \delta(q_1, b)$$

$$= \{q_0\} \cup \{q_2\}$$

$$= \{q_0, q_2\}$$

For state $\{q_0, q_2\}$:

$$\begin{aligned}\text{Input symbol} = a ; \delta(\{q_0, q_2\}, a) &= \delta(\{q_0, q_2\}, a) \\ &= \delta(q_0, a) \cup \delta(q_2, a) \\ &= \{q_0, q_1\} \cup \emptyset \\ &= \{q_0, q_1\}\end{aligned}$$

$$\begin{aligned}
 \text{Input Symbol} = b ; \quad \delta(\{q_0, q_2\}, b) &= \delta(\{q_0, q_2\}, b) \\
 &= \delta(q_0, b) \cup \delta(q_2, b) \\
 &= \{q_0\} \cup \emptyset \\
 &= \{q_0\}
 \end{aligned}$$

Since, no new state is generated this step is terminated.

Step 4: Identify the final states of DFA; Since q_2 is the final state of NFA in the above set, whenever q_2 is present as an element, the corresponding set is the final state of DFA. So, the final state is $\{q_0, q_2\}$.

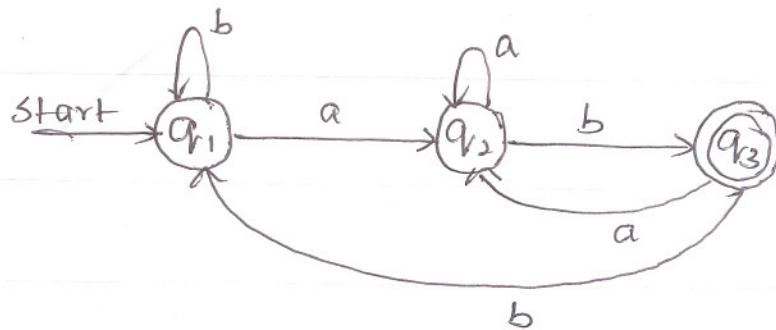

So, Transition Table,

δ	a	b	δ	a	b
$\rightarrow \{q_0\}$	$\{q_0, q_1\}$	$\{q_0\}$	A	B	A
$\{q_0, q_1\}$	$\{q_0, q_1\}$	$\{q_0, q_2\}$	B	B	C
$\neq \{q_0, q_2\}$	$\{q_0, q_1\}$	$\{q_0\}$	$\neq C$	B	A

By renaming the states

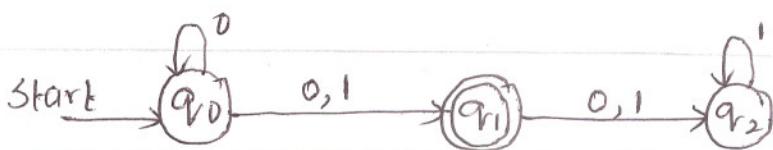

So, the final DFA is given by $m = (Q, \Sigma, \delta, q_0, F)$ where

- $Q = \{A, B, C\}$
- $\Sigma = \{a, b\}$
- $q_0 = A$
- $F = \{C\}$

PROBLEMS :

1 Convert the following NFA to its equivalent DFA

Soln: The transition table for the above DFA is given by

δ	0	1
$\rightarrow q_0$	$\{q_0, q_1\}$	$\{q_1\}$
$* q_1$	$\{q_2\}$	$\{q_2\}$
q_2	\emptyset	$\{q_2\}$

A. M. PRASAD
 Assistant Professor
 Department of Computer Science & Engineering
 Dayananda Sagar College of Engineering
 Bangalore - 560 078

Step 1 : Identify the start state of DFA ; $Q = \{q_0\}$

Step 2 : Identify the alphabets of DFA ; $\Sigma = \{0,1\}$

Step 3 : Identify the transitions of DFA ;

For state $\{q_0\}$:

$$\text{Input symbol} = 0 \quad ; \quad \delta(q_0, 0) = \delta(q_0, 0) \\ = \{q_0, q_1\}$$

$$\text{Input symbol} = 1 \quad ; \quad \delta(q_0, 1) = \delta(q_0, 1) \\ = \{q_1\}$$

For state $\{q_0, q_1\}$:

$$\text{Input symbol} = 0 \quad ; \quad \delta(\{q_0, q_1\}, 0) = \delta(\{q_0, q_1\}, 0) \\ = \delta(q_0, 0) \cup \delta(q_1, 0) \\ = (q_0, q_1) \cup \{q_2\} \\ = (q_0, q_1, q_2)$$

$$\begin{aligned}
 \text{Input symbol } &= 1 ; \quad \delta(\{q_0, q_1\}, 1) = \delta(\{q_0, q_1\}, 1) \\
 &= \delta(q_0, 1) \cup \delta(q_1, 1) \\
 &= \{q_1\} \cup \{q_2\} \\
 &= \{q_1, q_2\}
 \end{aligned}$$

For state $\{q_1\}$:

$$\text{Input symbol } = 0 ; \quad \delta(\{q_1\}, 0) = \delta(\{q_1\}, 0) = \{q_2\}$$

$$\text{Input symbol } = 1 ; \quad \delta(\{q_1\}, 1) = \delta(\{q_1\}, 1) = \{q_2\}$$

For state $\{q_0, q_1, q_2\}$:

$$\begin{aligned}
 \text{Input symbol } &= 0 ; \quad \delta(\{q_0, q_1, q_2\}, 0) = \delta(\{q_0, q_1, q_2\}, 0) \\
 &= \delta(q_0, 0) \cup \delta(q_1, 0) \cup \delta(q_2, 0) \\
 &= \{q_0, q_1\} \cup \{q_2\} \cup \{\phi\} \\
 &= \{q_0, q_1, q_2\}
 \end{aligned}$$

$$\begin{aligned}
 \text{Input symbol } &= 1 ; \quad \delta(\{q_0, q_1, q_2\}, 1) = \delta(\{q_0, q_1, q_2\}, 1) \\
 &= \delta(q_0, 1) \cup \delta(q_1, 1) \cup \delta(q_2, 1) \\
 &= \{q_1\} \cup \{q_2\} \cup \{q_2\} \\
 &= \{q_1, q_2\}
 \end{aligned}$$

For state $\{q_1, q_2\}$:

$$\begin{aligned}
 \text{Input symbol } &= 0 ; \quad \delta(\{q_1, q_2\}, 0) = \delta(\{q_1, q_2\}, 0) \\
 &= \delta(q_1, 0) \cup \delta(q_2, 0) \\
 &= \{q_2\} \cup \emptyset \\
 &= \{q_2\}
 \end{aligned}$$

$$\text{Input symbol } = 1 ; \quad \delta(\{q_1, q_2\}, 1) = \delta(\{q_1, q_2\}, 1)$$

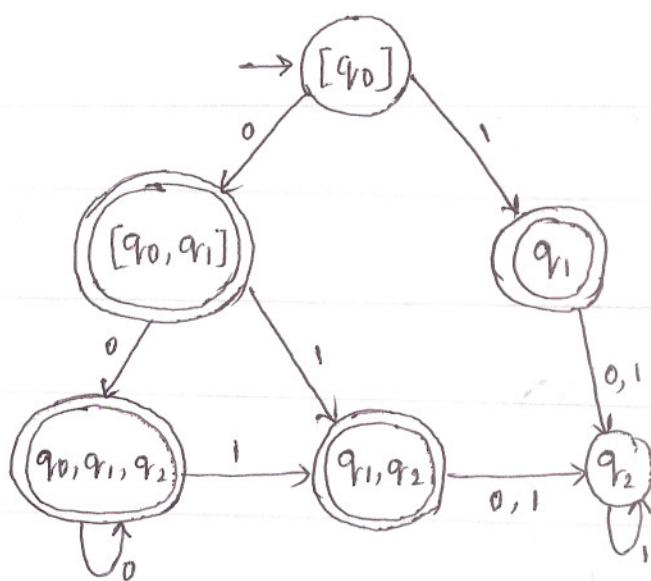

$$\begin{aligned}
 &= \delta(q_1, 1) \cup \delta(q_2, 1) \\
 &= \{q_2\} \cup \{q_2\} = \{q_2\}
 \end{aligned}$$

For state $\{q_2\}$:

$$\text{Input symbol } = 0 ; \quad \delta(\{q_2\}, 0) = \emptyset$$

$$\text{Input symbol } = 1 ; \quad \delta(\{q_2\}, 1) = q_2$$

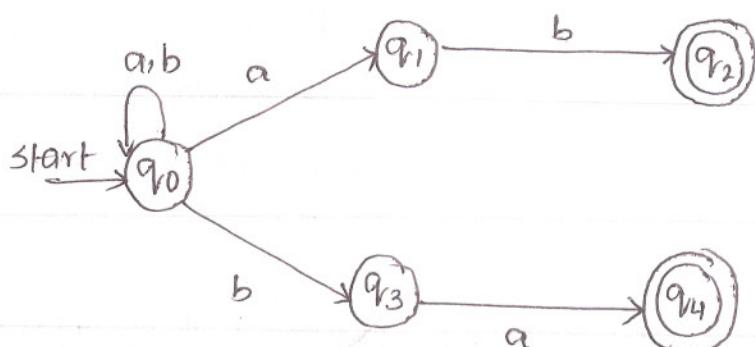

The final transition table along with transition diagram is shown below:

δ	0	1
$\{q_0\}$	$\{q_0, q_1\}$	$\{q_1\}$
$\{q_0, q_1\}$	$\{q_0, q_1, q_2\}$	$\{q_1, q_2\}$
$\{q_1\}$	$\{q_2\}$	$\{q_2\}$
$\{q_0, q_1, q_2\}$	$\{q_0, q_1, q_2\}$	$\{q_1, q_2\}$
$\{q_1, q_2\}$	$\{q_2\}$	$\{q_2\}$
$\{q_2\}$	\emptyset	$\{q_2\}$

- Q. Obtain an NFA to accept strings of a's and b's ending with ab or ba. From this NFA obtain an equivalent DFA.

SOLN: The NFA to accept strings of a's and b's ending with ab or ba is shown below:

A. M. PRASAD

Assistant Professor

Department of Computer Science & Engineering

Davulurappa Sagar College of Engineering

Bengaluru - 560 078

The transition table for the above transition diagram is shown below

δ	a	b
$\rightarrow q_0$	$\{q_0, q_1\}$	$\{q_0, q_3\}$
q_1	$\{\phi\}$	$\{q_2\}$
$* q_2$	ϕ	ϕ
q_3	q_4	ϕ
$* q_4$	ϕ	ϕ

Step 1 : Identify the start state of DFA = $\{q_0\}$

Step 2 : Identify the alphabets of DFA : $\Sigma = \{a, b\}$

Step 3 : Identify the transition of DFA :

For state $\{q_0\}$:

$$\text{Input symbol } a ; \quad \delta(q_0, a) = \{q_0, q_1\}$$

$$\text{Input symbol } b ; \quad \delta(q_0, b) = \{q_0, q_3\}$$

For state $\{q_0, q_1\}$:

$$\text{Input symbol } a ; \quad \delta(\{q_0, q_1\}, a) = \delta(q_0, a) \cup \delta(q_1, a)$$

$$= \{q_0, q_1\} \cup \phi$$

$$= \{q_0, q_1\}$$

$$\text{Input symbol } b ; \quad \delta(\{q_0, q_1\}, b) = \delta(q_0, b) \cup \delta(q_1, b)$$

$$= \{q_0, q_3\} \cup \{q_2\}$$

$$= \{q_0, q_2, q_3\}$$

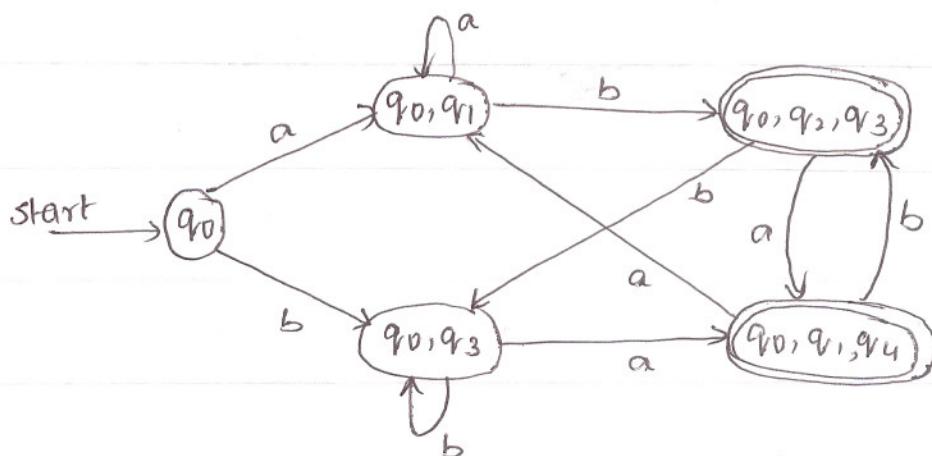

For state $\{q_0, q_3\}$:

$$\begin{aligned} \text{Input symbol } a ; \quad \delta(\{q_0, q_3\}, a) &= \delta(q_0, a) \cup \delta(q_3, a) \\ &= \{q_0, q_1\} \cup \{q_4\} \\ &= \{q_0, q_1, q_4\} \end{aligned}$$

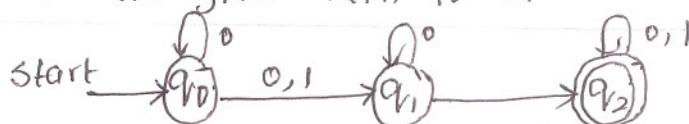

$$\begin{aligned} \text{Input symbol } b ; \quad \delta(\{q_0, q_3\}, b) &= \delta(q_0, b) \cup \delta(q_3, b) \\ &= \{q_0, q_3\} \cup \phi \\ &= \{q_0, q_3\} \end{aligned}$$

The final DFA obtained along with transition diagram and transition table is shown below

δ	a	b
$\rightarrow \{q_0\}$	$\{q_0, q_1\}$	$\{q_0, q_3\}$
$\{q_0, q_1\}$	$\{q_0, q_1\}$	$\{q_0, q_2, q_3\}$
$\{q_0, q_3\}$	$\{q_0, q_1, q_4\}$	$\{q_0, q_3\}$
$\ast \{q_0, q_2, q_3\}$	$\{q_0, q_1, q_4\}$	$\{q_0, q_3\}$
$\ast \{q_0, q_1, q_4\}$	$\{q_0, q_1\}$	$\{q_0, q_2, q_3\}$

SOLⁿ: Step 1: Identify the starting state of DFA : {P}

Step 2: Identify the alphabets of DFA : {0,1}

Step 3: Identify the transition of DFA :

For state {P}:

Input symbol = 0; $\delta(P, 0) = \{P, Q\}$

Input symbol = 1; $\delta(P, 1) = \{P\}$

For state $\{P, Q\}$:

$$\begin{aligned}\text{Input symbol} = 0; \quad \delta(\{P, Q\}, 0) &= \delta(P, 0) \cup \delta(Q, 0) \\ &= \{P, Q\} \cup \{\emptyset\} \\ &= \{P, Q\}\end{aligned}$$

$$\begin{aligned}\text{Input symbol} = 1; \quad \delta(\{P, Q\}, 1) &= \delta(P, 1) \cup \delta(Q, 1) \\ &= \{P\} \cup \{Q\} \\ &= \{P, Q\}\end{aligned}$$

For state $\{P, R\}$:

$$\begin{aligned}\text{Input symbol} = 0; \quad \delta(\{P, R\}, 0) &= \delta(P, 0) \cup \delta(R, 0) \\ &= \{P, Q\} \cup \{P, R\} \\ &= \{P, Q, R\}\end{aligned}$$

$$\begin{aligned}\text{Input symbol} = 1; \quad \delta(\{P, R\}, 1) &= \delta(P, 1) \cup \delta(R, 1) \\ &= \delta(P) \cup \delta(R) \\ &= \{P, Q\}\end{aligned}$$

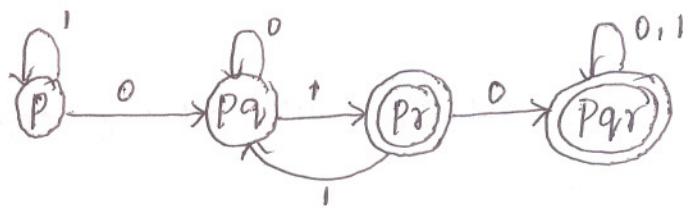

For state $\{P, Q, R\}$:

$$\begin{aligned}\text{Input symbol} = 0; \quad \delta(\{P, Q, R\}, 0) &= \delta(P, 0) \cup \delta(Q, 0) \cup \delta(R, 0) \\ &= \{P, Q\} \cup \{\emptyset\} \cup \{P, R\} \\ &= \{P, Q, R\}\end{aligned}$$

$$\begin{aligned}\text{Input symbol} = 1; \quad \delta(\{P, Q, R\}, 1) &= \delta(P, 1) \cup \delta(Q, 1) \cup \delta(R, 1) \\ &= \{P\} \cup \{R\} \cup \{Q\} \\ &= \{P, Q, R\}\end{aligned}$$
